Advanced C Programming

Lab Assignment #1

1- Identify the issue in the code, shortly explain why it is happening, and write down the corrected line of code.

```c
#include <stdio.h>

int main() {

    int score = 85;

    int *ptr = &score;

    printf("The student's score is: %d\n", ptr);

    return 0;

}
```

2- Let's say we want to write a program that asks the user for their **full name**. What should we use between `scanf("%s",name)` and `scanf("%[^\n]",name)`? And why? Explain briefly what will happen with each of the methods.

3- Write a functional "Daily Steps Tracker" C program for a week. The program must do the following tasks.

1. Declare a 1D array of integers of size 7.
2. Use a `for` loop to ask the user to input their steps for all 7 days.
3. Calculate the total sum and the average number of steps for the week.
4. Print the final average to the screen.

(You do not need to worry about the exact text formatting of the `printf` prompts, just ensure the logic and array syntax are correct)

Hint: When using an online compiler, be sure to use one that allows user inputs. For inputs you can separate the number either by space or line.

Good Luck!
